BUG BOUNTY

Dear Security Team,

I am writing to responsibly disclose a security vulnerability identified on your platform. During testing, I discovered a ****Reflected Cross-Site Scripting (XSS)**** vulnerability in one of your endpoints.

Summary:-

A reflected XSS vulnerability exists in the following endpoint:

Navigate URL :- <https://16thwwc.vfairs.com/en/form/editProfileV2>

The application reflects user-controlled input from URL parameters into the response without proper sanitization or encoding, allowing execution of arbitrary JavaScript in the victim's browser.

Vulnerable Parameter:- `mode` (and related parameters such as `ud\_profile`)

Proof of Concept (PoC)

Payload:- `><script>alert(9058)</script>`

Exploit URL:-

[https://16thwwc.vfairs.com/en/form/editProfileV2?access_id=&mode=&ud_profile="\)\(%26%25<zzz><ScRiPt>alert\(9058\)</ScRiPt>&user_id=N](https://16thwwc.vfairs.com/en/form/editProfileV2?access_id=&mode=&ud_profile=)

Steps to Reproduce:-

1. Open the above exploit URL in a browser
2. Ensure the payload is included in the parameter
3. Observe that a JavaScript alert (`9058`) is triggered automatically

Impact:-

This vulnerability can allow an attacker to:

- * Execute arbitrary JavaScript in users' browsers
- * Steal session cookies and hijack accounts
- * Perform actions on behalf of authenticated users
- * Conduct phishing attacks or inject malicious content

If exploited against privileged users, this could lead to full account compromise.

Recommended Remediation:-

To fix this issue, I recommend:

- * Implement strict **input validation** (allowlist-based filtering)
- * Apply proper **output encoding** (HTML/JS context-aware encoding)
- * Avoid reflecting raw user input in responses
- * Use established security libraries (e.g., OWASP ESAPI)
- * Implement a strong **Content Security Policy (CSP)**

Thank you for your time and efforts in maintaining platform security.
